

Initial background

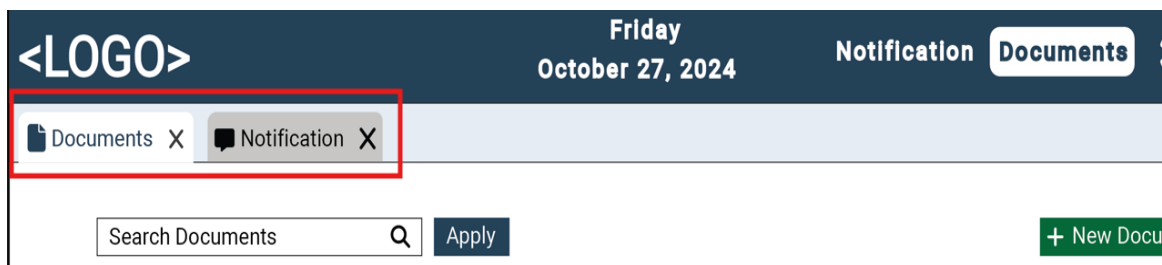

In the web page there should be an initial back which have the main top panel and the body to the application. In that main tab there should be a logo left side corner and buttons that required the most and the date and the time in the middle of the tab.

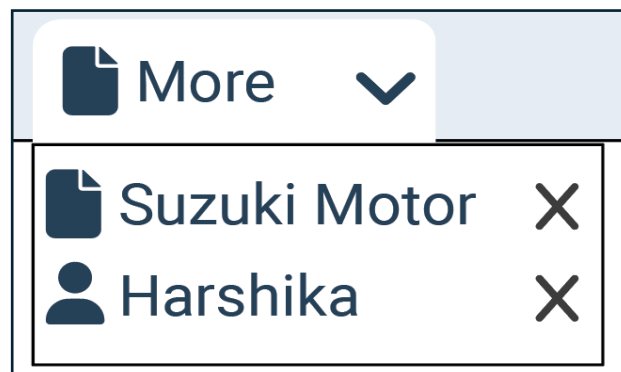

Also if the buttons are get overflowed to the left then as below suggest there should be a button called more to hold those extra overflowing items.

Tab opening like view

In the application each and every button which clicks initially and require new specific load of the application has to open in new tab instead of loading the webpage itself. See the below picture,

And there should be a closing tag for each and every tab the user tries to open. And also, to avoid the overflowing of the tabs horizontally when tabs reaches a specific length add an additional tab called more and display them open like a drop down menu and display the tabs there.

If the user clicks one of the tab inside that more tab that tab will come out that list and one of the tab which didn't clicks more often will go inside to that 'more' tab.

Using this feature,

- The application will have easy and efficient loading of tabs opening since this is an administrative purpose application.
- Also, some conflicts were forbidden since there are some situation where we want to work with several tabs. Now instead of loading them again and again one load will be enough until the end of the application.

As the colors of the tabs, it can vary but for now display the tab colors in the displayed blue and the text in white. The background should be white.
